

Matching the DISTRIBUTION, not just the mean — live box vs zero-extra-parameter Binomial survivor model
 $\text{occ} = 1 + \text{Binom}(a-2, p_o)$, $\text{rem} = \text{Binom}(d, p_r)$; p set so the mean equals the existing fitted curve

Capture: occupier strength (n=6,107)

Repel: defender remnant (n=3,279)

Per-margin mean total-variation distance: capture 0.103 repel 0.053 (0 = identical distribution). Spread is emergent from the binomial — no spread parameter was fit.
